$100 million project to make intelligence boosting brain implant.

https://www.prepabellevue.org/index.php?module=Site\&voir=document\&id_document=3979

Definition :

- hippocampus = memory part our brain
- prosthetic = artificial element integrated into the body to replace a damaged function

Key words and sentences :

- $100 million to develop a product to enhance human intelligence
- firstly to improve memory
- look after hippocampus
- study persons who have already implants
- examine the behavior to imitate them later
- already tested on animals and it's a successful test
- prosthetic to restore memory of people with memory disorders
- and next to improve memory for all of us.
- little and easy to implement
- next this experiment enhances another part of our brain

Abstract :

This $100 million project, led by entrepreneur Bryan Johnson, aims to develop a neural device designed to boost human intelligence, with an initial focus on enhancing memory through the hippocampus. By studying epilepsy patients who already have electrical brain implants, researchers are recording normal neural activity to understand how memory functions so they can eventually mimic it using personalized algorithms. Building on encouraging initial tests on animals, the primary medical objective is to create a neural prosthesis that restores memory in patients suffering from cognitive disorders or brain trauma. Beyond medical treatment, the

project's ultimate ambition is to create a small, easy-to-implant chip accessible to healthy individuals, thereby enhancing human memory and eventually expanding to stimulate other regions of the brain.

Opinion :

I chose this topic because transhumanism is featured in a lot of science fiction, and I found it really interesting to explore further. Neural implants are a great solution for treating people affected by brain diseases. If we cannot heal biologically, why not create a part to replace the defective area, just like a car part? If this proves to be possible and effective on humans, it would be amazing. However, if this technology expands to everyone—and not just patients—it could become problematic, as only the wealthiest people would gain a massive advantage over others, which would further widen inequalities, much like in Cyberpunk 2077.
